

Press release 09. July 2009

A sustainable, green flooring system.

Arnstorf, July 2009 - In the current crisis ridden times the significance of sustainability is increasing. Sustainable thinking and conduct according to ecological, economical and socio-cultural principles is the requirement for protecting and safeguarding nature and the environment for generations to come.

Lindner also follows this approach.

As early as the development stage, the environmental sustainability of our high quality products is the focus of our work. The use of materials and the consumption of energy in the later manufacturing processes are optimised as well as possible. The use of ecologically tested and approved raw materials sustainably protects the health of the building's users and ensures the longest possible service life of the product as well as "clean" recycling.

These products and the included services pave the way for the sustainable, economical, environmentally friendly and resource-efficient construction of buildings.

The Lindner Flooring System enables environmentally friendly and economically viable construction. For example Lindner gypsum panels for the access floor designs NORTEC and FLOOR and more® consist of almost 100% recycled materials. These panels are one of the most high quality products on the market with the best structural-physical properties. Before being selected, the adhesives used are thoroughly tested for any volatile materials.

A healthy environment is one of the most important objectives for the company.

Therefore the Lindner Environmental Management System - ISO 14001 compliant - ensures that energy consumption, emissions and waste accumulation are constantly reduced. The daily implementation of

extensive quality management - ISO 9001 compliant - forms the basis of this.

Thanks to its excellent ecological properties, Lindner Access Floor Systems can contribute significantly to building certification requirements according to the relevant standards of the U.S. Green Building Council (USGBC; evaluation system LEED) and the German Sustainable Building Council (DGNB). Therefore use the tender text for Lindner Access Floors as soon as you come to write the specification of your sustainable building project.
