

Press release 04. September 2009

Embossed weave - visual confusion with the new metal ceiling “CROSSdesign”.

Arnstorf, 4. September 2009 – Woven? Embossed? Metal ceilings with a surface structure that looks like a woven fabric, make you look twice. The ceiling consists of a perforated embossed plate. Its three-dimensional character is created through the combination of a special punching procedure with the impression of the perforation.

But the new design is not just visually interesting...

The “CROSSdesign” ceiling panels can be additionally equipped with noise absorbing inlays and can thus fulfil acoustic requirements. An ideal surface covering is the well known powder coating in grey - RAL 9006 - or “brilliant metallic”.

The various colours from the RAL and NCS colour systems also offer great alternatives. In order to make public buildings such as airports, stations or museums really eye-catching the interior must be compelling. In addition to the well known expanded metal ceilings, Lindner provides another attractive option for interior design with “corners and edges” thanks to “CROSSdesign”.
