

Ventilation with flow duct for Room-in-Room System

Lindner Cube solo

Flexible loading and venting system for room-in-room systems.

Suction of fresh air in the ground-level area is ensured by flow ducts.

The stale air is removed via fan modules.

A ventilation unit consists of two to eight fans. These are preset to the respective conditions.

For optional continuous fan control, the air exchange can be re-adjusted if necessary.

Depending on the requirement and size of the room, several units can be used to achieve the required air exchange.

For detailed information, see the data sheets in i.net.
